# Board of Trustees Meeting of September 21, 2016 Action Item Risk Based Capital/Surplus Study as of June 30, 2016

The Sigma Actuarial Consulting Group was engaged to perform a strategic Total Adjusted Capital/Risk Based Capital (TAC/RBC) analysis for NJSIG. Sigma used the Group's preliminary 06/30/16 financial reports which included the 06/30/16 Willis Towers Watson study of ultimate liabilities, the 06/30/16 GASB68 adjustments (as per the NJ KPMG state report), and the assumption of a \$3 million 2015/2016 safety grant.

The analysis for the range of the Group's surplus requirement relies on the concept of Risk Based Capital (RBC). RBC is an insurance industry financial evaluation tool defined by the National Association of Insurance Commissioner (NAIC) and is utilized by state insurance commissioners to measure the solvency of insurance companies licensed in their state. The RBC defines the minimum amount of capital (surplus) that an insurance carrier should maintain to allot for claims payments and is also the minimum surplus required to prevent authorized/regulatory agency intervention.

As per the Sigma study, the two major driving components of NJSIG's RBC calculations are claims reserves (at 55.17%) and net written premiums (at 36.03%). Sigma has calculated an adapted RBC after covariance of \$31.6 million. The NJSIG RBC ratio is 2.15. The NAIC industry RBC ratio is 3.36. The NJSIG total adjusted capital (TAC)/surplus threshold range would fall between the 2.15 and 3.36 RBC ratio. At 06/30/16, Sigma recommends a 06/30/2016 surplus target threshold between \$67.9 million and \$106.2 million. (Please see attached Section 5, Table 6 from Sigma's study for these results)

The projected 06/30/2016 NJSIG surplus (assuming a \$3 million safety grant) is \$68.2 million. This is within the study's targeted threshold of \$67.9 million and \$106.2 million.

Recommended Resolution: Accept the 6/30/2016 Sigma Actuarial Consulting Group study. Each year-end, until a new surplus study is performed, NJSIG should adopt the methodology that the NJSIG member equity (surplus) target threshold should minimally meet the adapted RBC value (as determined by Sigma), including a yearly inflation factor (as measured by the Consumer Price Index and published by the Bureau of Labor Statistics), times the RBC ratio range of 2.15 – 3.36 (as determined by Sigma). The Group's adapted RBC is to be evaluated at a minimum of every five years by an independent firm.

Note: Industry data is from NAIC's Aggregate P/C Results by Year for 2014 (excluding Catastrophe Risk).

RBC ratios in the NAIC document (and defined in the RBC for Insurers Model Act) are based on the Authorized Control Level RBC. Ratios in this analysis are based on the Total RBC After Covariance, which is two times the Authorized Control Level RBC.
